                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to an isolated polypeptide comprising one of 127 cc form of NOVX, an amino acid sequence which is at least 95% identical to CC form of NOVX, an amino acid sequence which is at least 95% identical to CC NOVX or an amino acid sequence which is at least 95% identical to CC groteins, determining the presence or more conservative proteins, determining the presence or amount of NOVX DNA in a cc sample (by introducing the sample to an antibody that binds or nore conservative compression of NOVX or NOVX DNA in a cc amount of antibody bound to the polypeptide, and determining the presence or c amount of antibody bound to the polypeptide), determining the presence of cc expression of NOVX or NOVX DNA in a first mammalian subject, identifying can agent that binds to NOVX, identifying a potential therapetic agent cf for treatment of a pathology related to aberrant expression or aberrant cc physiological interactions of NOVX, secretarily the therapetic agent comprising NOVX DNA, a cell comprising the vector (used to produce NOVX) and an anti-NOVX antibody. The NOVX mucleic acids and polypeptides care useful as a marker for cell or tissue type, and in diagnosing and consequences, including cardiomyopathy, atherosclerosis, hypertension, cc disease, multiple sclerosis, infectious diseases, anorexia, cancer cd disease, multiple sclerosis, infectious diseases, metabolic diseaser's cancer, diabetes, metabolic diseaser's concernsiated cachexia, neurodegenerative disorders (e.g. Alibeimer's concernsiated exchexia, neurodegenerative disorders (e.g. Alibeimer's concernsiated exchexia, neurodegenerative disorders, haemacopoiete of these may also be used to screen for molecules which inhibit or cenhance NoVX activity or function, and for detecting specific cell types. Cr bear may also be used to accompany gene therapy, tissue concerns concerns as sociated with or cenhance may also be decented as a novex brotein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    문
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           S

New polypeptides and polynucleotides having properties related to stimulation of biochemical or physiological responses in a cell or tissue, useful for diagnosing or preventing e.g. atherosclerosis, hypertension, prostate cancer.

Example C; Page 596; 849pp; English.

The invention relates to an isolated polypeptide comprising one of 127 CC sequences (appearing as ABO1218 ABO1414) designated as NOVX, a mature form of NOVX, an amino acid sequence which is at least 95% identical to CC (and the comprision of the comprision one or more conservative cCC substitutions in NOVX. Also included are nucleic acids encoding NOVX or an amino acid sequence computising one or more conservative cCC substitutions in NOVX. Also included are nucleic acids encoding NOVX cCC proteins, determining the presence or amount of NOVX or NOVX DNA in a CCC sample (by introducing the sample to an antibody that binds cCC amount of antibody bound to the polypeptide), determining the presence of CCC amount of antibody bound to the polypeptide), determining the presence of CCC expression of NOVX DNA in a first mammalian subject, identifying can agent that binds to NOVX, identifying a potential therapeutic agent CCC for treatment of a pathology related to aberrant expression or aberrant CCC physiological interactions of NOVX, screening for a modulator of activity of or of latency or predisposition to a pathology associated with NOVX, a cvector comprising NOVX DNA, a cell comprising the vector (used to produce NOVX) and an anti-NOVX antibody. The NOVX nucleic acids and polypeptides are useful as a marker for cell or tissue type, and in diagnosing and congenital heart defects, prostate cancer, diabetes, metabolic disorders, congenital heart defects, prostate cancer, diabetes, metabolic disorders, congenital heart defects, prostate cancer, diabetes, condainal asthma, Crohn's congenital cancer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 associated cachexia, neurodegenerative disorders (e.g. Alzheimer's disease or Parkinson's disease), immune disorders, haematopoietic disorders, dyslipidaemias, and wasting disorders associated with chronic diseases. These may also be used to screen for molecules which inhibit or enhance NOVX activity or function, and for detecting specific cell types. These may also be used in chromosome mapping, gene therapy, tissue typing, and in foreneit biology. The present sequence is a reverse transcriptase (RT)-PCR probe used to assess the tissue specific expression of mRNA encoding a NOVX protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; ss; PCR; NOVX; cardiomyopathy; atherosclerosis; hypertension; congenital heart defect; prostate cancer; diabetes; metabolic disord neoplasm; graft versus host disease; bronchial asthma; probe; Crohn's disease; multiple sclerosis; infectious disease; anorexia; cancer-associated cachexia; neurodegenerative disorder; RT-PCR; Alzheimer's disease; Parkinson's disease; immune disorder;

New polypeptides and polynucleotides having stimulation of biochemical or physiological tissue, useful for diagnosing or preventing hypertension, prostate cancer. properties related (responses in a cell e.g. atherosclerosis, 1 or

Example C; Page 608; 849pp; English

The invention relates to an isolated polypeptide comprising one of 127 CC sequences (appearing as ABO1288-ABO1414) designated as NOVX, a mature CC form of NOVX, an amino acid sequence which is at least 95% identical to CC NOVX or an amino acid sequence comprising one or more conservative cC substitutions in NOVX. Also included are nucleic acids encoding NOVX CC proteins, determining the presence or amount of NOVX DNA in a CC sample (by introducing the sample to an antibody that binds correct or amount of NOVX DNA in a CC amount of antibody bound to the polypeptide, and determining the presence or cc amount of antibody bound to the polypeptide), determining the presence or cc amount of antibody bound to the polypeptide, and determining the presence or cc amount of antibody bound to the polypeptide, and the therapeutic agent cc an agent that binds to NOVX DNA in a first mammalian subject, identifying can agent that binds to NOVX, identifying a potential therapeutic agent cf or treatment of a pathology related to aberrant expression or aberrant cc physiological interactions of NOVX, screening for a modulator of activity of or of latency or predisposition to a pathology associated with NOVX, a ccl comprising the vector (used to produce CC NOVX) and an anti-NOVX antibody. The NOVX nucleic acids and polypeptides are useful as a marker for cell or tissue type, and in diagnosing and CC are useful as a marker for cell or tissue type, and in diagnosing and congenital heart defects, prostate cancer, diabetes, metabolic disorders, congenital heart defects, prostate cancer, diabetes, metabolic disorders, associated with congenital actima, neurodegenerative disorders (e.g. Alzheimer's CC disease or parkinson's disease, immune disorders (e.g. Alzheimer's CC disease or parkinson's disease), immune disorders (e.g. Alzheimer's CC disease or parkinson's disease), immune disorders (e.g. Alzheimer's condisorders, displaced with chronic disorders associated with chronic disorders associated with chronic conditions or disorders assoc disorders, dyslipidaemias, and wasting discuters which diseases. These may also be used to screen for molecules which enhance NOVX activity or function, and for detecting specific or These may also be used in chromosome mapping, gene therapy, tis typing, and in forensic biology. The present sequence is a revetranscriptase (RT)-PCR probe used to assess the tissue specific expression of mRNA encoding a NOVX protein cell types.

New polypeptides and polynucleotides having properties related to stimulation of blochemical or physiological responses in a cell or tissue, useful for diagnosing or preventing e.g. atherosclerosis, hypertension, prostate cancer.

Example ů Page 712; 849pp; English

The invention relates to an isolated polypeptide comprising one of 127 sequences (appearing as ABO1288-ABO1414) designated as NOVX, a mature form of NOVX, an anino acid sequence which is at least 95% identical to NOVX or an amino acid sequence comprising one or more conservative substitutions in NOVX. Also included are nucleic acids encoding NOVX proteins, determining the presence or amount of NOVX DNA in a sample (by introducing the sample to an antibody that binds immunospecifically to the polypeptide, and determining the presence or amount of antibody bound to the polypeptide), determining the presence or predisposition to a disease associated with altered levels of 0f

> cc expression of NOVX or NOVX DNA in a first mammalian subject, identifying an agent that binds to NOVX, identifying a potential therapeutic agent crown treatment of a pathology related to aberrant expression or aberrant cphysiological interactions of NOVX, screening for a modulator of activity cof or of latency or predisposition to a pathology associated with NOVX, a core respectively. The vector comprising NOVX DNA, a cell comprising the vector (used to produce NOVX) and an anti-NOVX antibody. The NOVX nucleic acids and polypeptides are useful as a marker for cell or tissue type, and in diagnosing and creating pathologies, diseases, conditions or disorders associated with NOVX sequences, including cardiomyopathy, atherosclerosis, hypertension, congenital heart defects, prostate cancer, diabetes, metabolic disorders, congenital heart defects, prostate cancer, diabetes, metabolic disorders, complasm, graft versus host disease, AIDS, bronchial asthma, Crohn's complasm, graft versus host disease, AIDS, bronchial asthma, Crohn's complasm, graft versus host disease, and seases, anorexia, cancercassociated cachexia, neurodegenerative disorders (e.g. Alzheimer's cassociated cachexia, neurodegenerative disorders, haematopoietic disorders, dyslipidaemias, and wasting disorders, haematopoietic with inhitic called the complasment of the complasment of the chirchian called with chronic disorders, and associated with chronic disorders. disorders, dyslipidaemias, and wasting disorders associated with chronic diseases. These may also be used to screen for molecules which inhibit or enhance NOVX activity or function, and for detecting specific cell types. These may also be used in chromosome mapping, gene therapy, tissue typing, and in forensic biology. The present sequence is a reverse transcriptase (RT)-PCR probe used to assess the tissue specific expression of mRNA encoding a NOVX protein Sequence 21 BP; 5 A; 8 C; 6 G; 2 T; 0 U; 0 Other;

These may also be used to screen for molecules which inhibit or enhance NOVX activity or function, and for detecting specific cell types. These may also be used in chromosome mapping, gene therapy, tissue typing, and in forensic biology. The present sequence is a reverse
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New polypeptides and polynucleotides having properties related to stimulation of biochemical or physiological responses in a cell or tissue, useful for diagnosing or preventing e.g. atherosclerosis,

```
The invention relates to an isolated polypeptide comprising one of 127 CC sequences (appearing as ABO1288-ABO1414) designated as NOVX, a mature form of NOVX, an amino acid sequence which is at least 95% identical to CC NOVX or an amino acid sequence comprising one or more conservative substitutions in NOVX. Also included are nucleic acids encoding NOVX CC proteins, determining the presence or amount of NOVX DNA in a CC sample (by introducing the sample to an antibody that binds correct camount of antibody bound to the polypeptide, and determining the presence or CC amount of antibody bound to the polypeptide), determining the presence or CC camount of NOVX or NOVX DNA in a first mammalian subject, identifying an agent that binds to NOVX, identifying a potential therapeutic agent (corrector comprising NOVX DNA, in a first mammalian subject, identifying an agent that binds to NOVX, identifying a potential therapeutic agent (corrector comprising NOVX DNA, in a first mammalian subject, identifying an of interactions of NOVX, screening for a modulator of activity of or or flatency or predisposition to a pathology associated with NOVX, a corrector comprising NOVX DNA, a cell comprising the vector (used to produce the corrector comprising NOVX DNA, a cell comprising the vector (used to produce treating pathologies, diseases, conditions or disorders associated with NOVX, and an anti-NOVX antibody. The NOVX nucleic acids and polypeptides are useful as a marker for cell or tissue type, and in diagnosing and comprising pathologies, disease, and polypeptides are useful as a marker for cell or tissue type, and in diagnosing and comprising pathologies, disease, and solutes, metabolic disorders, neoplasm, graft versus host disease, AIDS, bronchial asthma, Crohn's comprision of disease, and soluted with chronic comprision of the com

New polypeptides and stimulation of bioche New polypeptides and polynucleotides having properties related to stimulation of biochemical or physiological responses in a cell or tissue, useful for diagnosing or preventing e.g. atherosclerosis, hypertension, prostate cancer.

Example C; Page 702; 849pp; English.

The invention relates to an isolated polypeptide comprising one of 127 CC sequences (appearing as ABO1288-ABO1414) designated as NOVX, a mature form of NOVX, an amino acid sequence which is at least 95% identical to CC NOVX or an amino acid sequence comprising one or more conservative cC substitutions in NOVX. Also included are nucleic acids encoding NOVX CC proteins, determining the presence or amount of NOVX DNA in a CC sample (by introducing the sample to an antibody that binds or amount of antibody bound to the polypeptide), determining the presence or amount of antibody bound to the polypeptide, and determining the presence of cor predisposition to a disease associated with altered levels of cor predisposition to a disease associated with altered levels of cor predisposition to a disease associated with altered levels of cor predisposition to a disease associated with altered levels of cor predisposition to a pathology associated with NOVX, is created for treatment of a pathology related to aberrant expression or aberrant cor physiological interactions of NOVX, screening for a modulator of activity of or of latency or predisposition to a pathology associated with NOVX, a cell comprising the vector (used to produce NOVX) and an anti-NOVX antibody. The NOVX nucleic acids and polypeptides are useful as a marker for cell or tissue type, and in diagnosing and consenting pathologies, diseases, conditions or disorders associated with NOVX consential heart defects, prostate cancer, diabetes, metabolic disorders, congenital heart defects, prostate cancer, diabetes, metabolic disorders, associated with consenses, conditions or disorders associated with consenses or parkinson's disease, conditions of diseases, anothial asthma, Crohn's diseases. These may also be used to screen for molecules which inhibit or disorders, dyslipidemias, and wasting disorders associated with chronic diseases. These may also be used to screen for molecules which inhibit or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       typing, and Transcriptase (RT)-rc. transcriptase (RT)-rc. f
                         first nucleic acid subfragment encoding aspartokinase (AK) that is substantially insensitive to inhibition by lysine, and a second nucleic acid subfragment encoding dihydrodipicolinic acid synthase (DHDPS) that is substantially insensitive to inhibition by lysine. Also included are an isolated nucleic acid fragment comprising a nucleic acid subfragment encoding lysine ketoglutarate reductase (LKR), a chimaeric gene (where the nucleic acid fragment is operably linked to a plant chloroplast transit sequence and to a seed-specific regulatory sequence, a plant comprising the nucleic acid/chimaeric gene in its genome, a seed obtaine from the plant, increasing threonine or lysine content of the seeds of plant, a plant capable of transmitting the chimaeric gene to a progeny c plant having the ability to produce levels of free threonine or lysine as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              enhance NO

CC lysine at a level at least ten percent to four fold higher than the seeds CC lysine at a level at least ten percent to four fold higher than the seeds CC of an untransformed plant, a transformed rapeseed comprising seeds that CC accumulate lysine to a level between ten percent and one hundred percent CC comprising in its genome the nucleic acid fragment having the monocotembry specific promoter and a transformed corn plant comprising seeds CC that accumulate lysine to a level between ten percent and one hundred thirty percent higher than the seeds of the untransformed plant. Also CC disclosed are synthetic lysine-rich seed storage proteins (SSP), built up CC from monomer lysine-rich heptad repeats (encoded by Earl restriction CC enzyme-based oligonucleotides) used as a pool of lysine in a transformed CC plant. The nucleic acid fragments, genes and methods are useful for CC increasing threonine or lysine content of the seeds of the plant. Seeds CC containing increased threonine or lysine or threonine produced via CC encoding a lysine-rich heptad repeat sequence is one strand of a DNA CC encoding a lysine-rich heptad repeat for use as a monomer unit in a content of a system of the seeds of the seeds containing a lysine-rich heptad repeat for use as a monomer unit in a content of a system or threonine produced via the content of a system or threonine produced via the content of a system or threonine produced via the content of a system or threonine produced via the content of a system or threonine produced via the content of a system or threonine produced via the content of a system or threonine produced via the content of a system or threonine or system or threonine produced via the content of a system or threonine or system or threonine o

Inhibiting HIV replication by inhibiting ATM and Rad-3 related protein (ATR), Rad17 or an inhibitor of an ATR-controlled pathway, useful for inhibiting infectivity of ATR or Rad17, and for preventing or treating infection.

Example 2; 27; 50pp; English

The invention relates to inhibiting HIV replication comprising contact a cell susceptible to HIV infection with an inhibitor of ATM and Radirelated protein (ATR) or Radil, or an inhibitor of an ATR-controlled pathway, to inhibit HIV replication in the cell. The methods and compositions of the present invention are useful for inhibiting contacting

                                    The invention relates to the 37-kDa protein of Streptococcus pneumoniae and the nucleic acid encoding it. The sequences of the invention are used in preparation of vaccines. The polypeptide is used to detect the presence of S. pneumoniae in a sample by contacting an antibody-containing sample from the subject with the polypeptide and detecting the binding of the antibody with the polypeptide, where binding indicates the presence of S. pneumoniae. An antibody to the polypeptide is also used to detect the presence of S. pneumoniae in a sample by contacting a sample of the subject with the antibody and detecting binding of the antibody with an antigen, where binding indicates the presence of S. pneumoniae in the subject with the antibody and detecting binding of the antibody the nucleic acid or an anti-idiotope antibody to the polypeptide encoded by the nucleic acid or an anti-idiotope antibody to the polypeptide, is used to prevent S. pneumoniae infection in a subject. This sequence represents a PCR primer used to amplify DNA encoding the 37-kDa polypeptide of the
                                                                                                                                                                                                                                                                                                                                                                                                          (SAMP/)

  The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the human Myc or Myb genes by RNA interference. The siNAs may or may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonucleotide and an antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (siRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised,

The invention also relates to kits for the in vitro or in vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of the Myc or Myb genes in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be used for treating cancers and other proliferative diseases, such as restenosis and polycystic kidney disease. The siNAs are also useful for drug screening, diagnosis, therapeutic target identification and validation, genetic engineering nharms organisms studying gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                            Zymolase of agricultural chemical containing organic phosphorus and coding gene and preparing process.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  validation, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Mcswiggen i
Jamison S,
                                                                                                                                                                                                                            useful for down-regulating the expression of an endogenous mammalian target gene and therefore in the treatment of any disease or condition that responds to modulation of gene expression or activity in a cell, tissue or organism. The disease or condition may include pulmonary diseases such as restenosis, atherosclerosis, Alzheimer's disease, Parkinson's disease, epilepsy, dementia, huntington's disease or amyotrophic lateral sclerosis. Furthermore, the siNA may be utilised fo gene therapy applications. The current sequence is that of the siNA DNA RNA hybrid of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    20-FEB-2002; 2002US-0358580P

                                                                                                                                                                                                                  The present invention relates to the isolation of Streptococcus pneumoniae 37kDa surface adhesin A protein, and the polynucleotide sequence encoding it. Also disclosed are antibodies to the 37kDa polypeptide, and methods of detecting the presence of S. pneumoniae sequences and methods are useful for preventing and treating S. pneumoniae infection. The present sequence represents a PCR primer pneumoniae serotype 6B gene.
                                                                                                                                                                                                                                                                                                                         Novel nucleic acid encoding Streptococcus pneumoniae 37-kDa surface adhesion A protein useful for preventing Streptococcus pneumoniae infection in subject.
                                                                                                                                                                                                Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 the envelope derived from: an MIV genome; and a gibbon ape leukemia viru (GaLV). Virions produced by expressing the viral genome of the chimeric plasmid are useful as positive controls in a test for detection of replication-competent retroviruses in preparations of MIV-GaLV-type retroviral vectors. For example, to ensure that the MIV-GaLV-type retroviral vectors, intended for gene therapy, have no capacity for replication. This polynucleotide sequence represents a primer used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 21 BP; 5 A; 3 C; 9 G; 4 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 replicative retroviral genome. The replicative retroviral genome comprises: the gag and pol sequences from a murine leukemia virus (MLV); and a chimeric env sequence comprising regions corresponding to parts of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Chimeric plasmid containing replicative retroviral genome, useful for making positive control virions in testing for replication-competent retrovirus.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to late gestation lung (LGL) 1 polypeptides and encoding polynucleotides. The LGL1 polypeptides can be expressed by standard recombinant methodology. The LGL1 polypeptides, polynucleotides and modulators are useful for modulating lung disease, alivary branching and/or abnormal alveolarization. The lung disease is bronchopulmonary dysplasia (BPD), emphysema, New BPD, chronic obstructive pulmonary disease (COPD), congenital diaphragmatic hernia (CDH), chronic bronchial infection, in a human with a deficiency of alpha-1-antitrypsin. The LGL1 polypeptide or polynucleotide is useful for the preparation of a medicament for use in the treatment of lung disease or disorder. They are useful in research, diagnostics and the preparation of therapeutics to treat diseases. The present sequence represents a primer used in RT-PCR amplification reactions of the rat LGL1 DNA
                                                                                                                                                                                                                                                                                                                     ss; hybridisation; capture oligonucleotide; pattern; mucosal; hair root; blood; nerve; germ cell; food additive; food supplement.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel late gestation lung 1 polypeptide and lgll genes encoding the polypeptide, useful for preparing a medicament for use in the treatment

\mathbf{z}_{\mathbf{x}}^{\mathbf{x}}
                                                                           CC comprise variable and non-variable regions. The capture olloponuclectides comprises variable anchor region, the complement of which is present at CC least once in each nucleic acid and a 3 -variable, discriminatory region that comprises all possible combinations of up to 10 nucleotides to allow cCC binding of particular sorts of single stranded nucleic acids. The capture CC agents are particularly locked nucleic acids (LNA) and the anchor region CC comprises a sequence of 10-50, particularly 15-25, T residues. The CC capture oligonucleotides are biotinylated and immobilised on a surface by CC interaction with streptavidin. The matrix is of plastic, ceramic, glass, CC metal, resin, gel, crystalline material and/or membrane, having semi-CC conducting properties and especially in the form of a chip. Its surface is particularly a layer of (bio)molecular filaments and binding of single CC stranded nucleic acids to the surface is (quasi)covalent, supramolecular, CC physical, stimulated by an electrical field or through a molecular sieve. CC physical, stimulated by an electrical field or through a molecular sieve. CC hair root, blood, nerve or germ cells and (ii) for determining the acids (amino, carboxylic or fatty scially minerals, trace elements, organic acids (amino, carboxylic or fatty acid) or their derivatives, salts and captures. The method provides rapid, inexpensive and reproducible representation of differences in pools of nucleic acids from cells. It captures years are all differences in the nucleic acid pool. Since the method of the complete pattern of all nucleic acid pool. Since the capture years used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention describes a novel method for sorting single-stranded nucleic acids by isolation and hybridisation of nucleic acid pools, reading out, where the nucleic acids are selectively bound using car

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 creading out, where the nucleic acids are selectively bound using capture comprise variable and non-variable regions. The capture oligonucleotides comprise variable anchor region, the complement of which is present at least once in each nucleic acid and a 3'-variable, discriminatory region that comprises all possible combinations of up to 10 nucleotides to binding of particular sorts of single stranded nucleic acids. The capture comprises a sequence of 10-50, particularly 15-25, T residues. The capture agents are particularly locked nucleic acids (LNA) and the anchor region comprises a sequence of 10-50, particularly 15-25, T residues. The capture oligonucleotides are biotinylated and immobilised on a surface by interaction with streptavidin. The material and/or membrane, having semi-conducting properties and especially in the form of a chip. Its surface is particularly alayer of (bio)molecular filaments and binding of single cardistotical, stimulated by an electrical field or through a molecular sieve. The method is used (i) for analysis of patterns, especially in mucosal, hair root, blood, nerve or germ cells and (ii) for determining the acids (amino, carboxylic or fatty acid) or their derivatives, salts and cardistors of differences in pools of nucleic acids from cells. It cardistors of the complete pattern of all nucleic acid in a cell, and can detect very small differences in pools of nucleic acid from cells. It can detect very small differences in the mucleic acid sold in a cell, and can detect very small differences in the mucleic acid sold. Not individual companies made in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

CC have a 5'-invariable anchor region, the complement of which is present at C least once in each nucleic acid and a 3'-variable, discriminatory region CC that comprises all possible combinations of up to 10 nucleotides to allow binding of particular sorts of single stranded nucleic acids. The capture CC agents are particularly locked nucleic acids (LMA) and the anchor region CC comprises a sequence of 10-50, particularly 15-25, T residues. The CC capture oligonucleotides are biotinylated and immobilised on a surface by interaction with streptavidin. The material and/or membrane, having semi-CC conducting properties and especially in the form of a chip. Its surface is particularly a layer of (bio)molecular filaments and binding of single conducting properties and especially in the form of a chip. Its surface CC is particularly a layer of (bio)molecular filaments and binding of single conducting properties and especially in the form of a chip. Its surface CC is particularly a layer of (bio)molecular filaments and binding of single conducting properties and especially in the form of a chip. Its surface is (quasi)covalent, supramolecular, the method is used (1) for analysis of patterns, especially in mucosal, and introverse or supplements, especially minerals, trace elements, organic CC acids (amino, carboxylic or farty acid) or their derivatives, salts and CC acids (amino, carboxylic or farty acid) or their derivatives, salts and CC acids (amino, carboxylic or farty acid) or their derivatives, salts and CC can detect very small differences in pools of nucleic acids from cells. It can detect very small differences in the mucleic acids from cells. It can detect very small differences in the mucleic acid soid in a cell, and CC can detect very small differences in the mucleic acid soid in a cell, and CC can detect were small differences in the mucleic acid soid in a cell, and CC can detect with a complete pattern of all nucleic acid in a cell, and CC capture probes used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This invention describes a novel method for sorting single-stranded nucleic acids by isolation and hybridisation of nucleic acid pools, then reading out, where the nucleic acids are selectively bound using capture agents that are (a) immobilised on the surface of a solid matrix and (b) comprise variable and non-variable regions. The capture objectives comprise variable and non-variable regions.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CC have a 5'-invariable anchor region, the complement of which is present at CC least once in each nucleic acid and a 3'-variable, discriminatory region that comprises all possible combinations of up to 10 nucleotides to allow binding of particular sorts of single stranded nucleic acids. The capture agents are particularly locked nucleic acids (LNA) and the anchor region CC comprises a sequence of 10-50, particularly 15-25, T residues. The CC capture oligonucleotides are biotinylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass, CC metal, resin, gel, crystalline material and/or membrane, having semicontainty resin, gel, crystalline material and/or membrane, having semicontainty a layer of (bio)molecular filaments and binding of single stranded nucleic acids to the surface is (quasi)covalent, supramolecular, CC physical, stimulated by an electrical field or through a molecular sieve. The method is used (i) for analysis of patterns, especially in mucosal, hair root, blood, nerve or germ cells and (ii) for determining the acids (amino, carboxylic or fatty acid) or their derivatives, salts and CC acids (amino, carboxylic or fatty acid) or their derivatives, salts and CC acids (amino, carboxylic or fatty acid) or their derivatives, salts and CC acids (amino per semilative) acids representation of differences in pools of nucleic acids from cells. It can be the method provides rapid, inexpensive and reproducible method is based on comparison of nucleic acid pool, Since the CC antivity or pattern semilaturisation is possible. ADK01201-ADK01344 represent comparison of nucleic acid pool, since the comparison of the nucleic acid pool since the comp
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches

```
comprise variable and non-variable regions. The capture oligonucleotides to have a 5'-invariable anchor region, the complement of which is present at Cleast once in each nucleic acid and a 3'-variable, discriminatory region that comprises all possible combinations of up to 10 nucleotides to allow binding of particularly locked nucleic acids (LNA) and the anchor region comprises as sequence of 10-50, particularly 15-25, T residues. The capture capture oligonucleotides are biotinylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass, conducting properties and especially in the form of a chip. Its surface is particularly a layer of (bio)molecular filaments and binding of single stranded nucleic acids to the surface is (quasi) covalent, supramolecular, cphysical, stimulated by an electrical field or through a molecular sieve. The method is used (i) for analysis of patterns, especially in mucosal, hair root, blood, nerve or germ cells and (ii) for determining the acids (amino, carboxylic or fatty acid) or their derivatives, salts and captures. The method provides rapid, inexpensive and reproducible representation of differences in pools of nucleic acids from cells. It callows imaging of the complete pattern of all nucleic acid in a cell, and can detect very small differences in the nucleic acid pool. Since the method is based on comparison of nucleic acid pools, since the capture probes used in the method of the invention.
reading out, where the nucleic acids are selectively bound using capture agents that are (a) immobilised on the surface of a solid matrix and (b)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Example; Page 5; 8pp; German

                                                                                                                                                                                                                                                       S
                                                                                                                                                                                                                                                                                                                                                                              Comprise variable and non-variable regions. The capture origonucleotides to have a 5'-invariable anchor region, the complement of which is present at CC least once in each nucleic acid and a 3'-variable, discriminatory region CC that comprises all possible combinations of up to 10 nucleotides to allow binding of particular sorts of single stranded nucleic acids. The capture CC asputes are particularly locked nucleic acids (INA) and the anchor region CC comprises a sequence of 10-50, particularly 15-25, T residues. The CC capture oligonucleotides are biotinylated and immobilised on a surface by interaction with streptavidin. The material and/or membrane, having semi-CC enducting properties and especially in the form of a chip. Its surface is particularly a layer of (bio)molecular filaments and binding of single conducting properties and especially in the form of a chip. Its surface is particular, the method is used (i) for analysis of patterns, especially in mucosal, compusited by an electrical field or through a molecular sieve. CC The method is used (i) for analysis of patterns, especially in mucosal, hair root, blood, nerve or germ cells and (ii) for determining the catific continuous composition or nutritional compounds, e.g. food cadditives or supplements, especially minerals, trace elements, organic caids (anino, carboxylic or fatty acid) or their derivatives, salts and composentation of differences in pools of nucleic acids from cells. It can detect very small differences in hools of nucleic acids from cells, and composine of nucleic acid sols, not individual composition is possible. ADK01281-ADK01344 represent composition is possible. ADK01281-ADK01344 represent composition is possible.

This invention describes a novel method for sorting single-stranded conclusive acids by isolation and hybridisation of nucleic acid gools, then compared the mucleic acids are selectively bound using capture compared that are (a) immobilised on the surface of a solid matrix and (b) comprise variable and non-variable regions. The capture oligonucleotides capture as '-invariable anchor region, the complement of which is present at compared to machine acid and a 3'-variable, discriminatory region compared to one in each nucleic acid and a 3'-variable, discriminatory region compared to particular sorts of single stranded nucleic acids. The capture oligonucleotides to allow binding of particularly locked nucleic acids (LMA) and the anchor region comprises a sequence of 10-50, particularly 15-25, T residues. The capture oligonucleotides are biotinylated and immobilised on a surface by interaction with streptavldin. The matrix is of plastic, ceramic, glass, conducting properties and especially in the form of a chip. Its surface to stranded nucleic acids to the surface is (quasi) ovalent, supramolecular, physical, stimulated by an electrical field or through a molecular sieve. The method is used (1) for analysis of patterns, especially in mucosal, thair root, blood, nerve or germ cells and (1) for determining the activity of pharmaceuticals and/or nutritional compounds, e.g. food cadditives or supplements, especially minerals, trace elements, organic acids (amino, carboxylic or fatty acid) or their derivatives, salts and captures. The method provides rapid, inexpensive and reproducible cacids (amino, carboxylic or fatty acid) or their derivatives, salts and capture prohes and acid pools, not individual genes, matrix miniaturisation of nucleic acid pools, not individual capture prohes used in the method of the invention.
                                                                                                                                       Query Match
                                                                                                                                                                                                                  Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sorting single-stranded nucleic acid, useful for analyzing expression patterns and screening active agents, uses capture agent with variable

                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CC binding of particular sorts of single stranded nucleic acids. The capture CC agents are particularly locked nucleic acids (LNA) and the anchor region CC comprises a sequence of 10-50, particularly 15-25, T residues. The CC capture oligonucleotides are biotinylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass, CC metal, resin, gel, crystalline material and/or membrane, having semication triple of the surface is quasilocoral triple of single conducting properties and especially in the form of a chip. Its surface is particularly a layer of (bio)molecular filaments and binding of single conducting to the surface is (quasi)covalent, supramolecular, CC physical, stimulated by an electrical field or through a molecular sieve. The method is used (i) for analysis of patterns, especially in mucosal, cartivity of pharmaceuticals and/or nutritional compounds, e.g. food cativity of pharmaceuticals and/or nutritional compounds, e.g. food cacivity of pharmaceuticals and/or nutritional compounds, e.g. food cacivity of pharmaceuticals and/or nutritional compounds, e.g. food cacivity of pharmaceuticals and/or nutritional compounds, e.g. food cacids (amino, carboxylic or fatty acid) or their derivatives, salts and cacids (amino, carboxylic or fatty acid) or their derivatives, salts and cacids in a capture or salts and companies on funcleic acids from cells. It can be method provides rapid, inexpensive and reproducible cacid shaging of the comparison of nucleic acid pool. Since the method is based on comparison of nucleic acid pool. Since the capture probes in the nucleic acid pool. Since the method is the method of the invention.
                                                                                                                                                                               Matches

The capture oligonucleotides have a 5'-invariable anchor region, the complement of which is present at least once in each nucleic acid and a 3'-variable, discriminatory region that comprises all possible combinations of up to 10 nucleotides to allow binding of particular sorts of single stranded nucleic acids. The capture
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sorting single-stranded nucleic acid, useful for analyzing expression patterns and screening active agents, uses capture agent with variable
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ss; hybridisation; capture oligonucleotide; pattern; mucosal; hair root;

Computes variable and of region, the complement of which is present at least once in each nucleic acid and a 3 -variable, discriminatory region CC that comprises all possible combinations of up to 10 nucleotides to allow CC binding of particular sorts of single stranded nucleic acids. The capture CC agents are particularly locked nucleic acids (LMA) and the anchor region CC comprises a sequence of 10-50, particularly 15-25, T residues. The CC capture oligonucleotides are biotinylated and immobilised on a surface by CC interaction with streptavidin. The material and/or membrane, having semication treath, resin, gel, crystalline material and/or membrane, having semication resin, gel, crystalline material and/or membrane, having semication treath and/or membrane, having semication and the surface is quasi) covalent, supramolecular, comparison to the surface is (quasi) covalent, supramolecular, comparison to network or germ cells and (ii) for determining the cacid stanto, carboxylic or germ cells and (ii) for determining the cacid stanto, carboxylic or fatty acid) or their derivatives, salts and cacid stanto, carboxylic or fatty acid) or their derivatives, salts and can detect very small differences in pools of nucleic acids from cells. It can detect very small differences in the nucleic acid pool. Since the method is based on comparison of nucleic acid pools, not individual computer probes used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention describes a novel method for sorting single-stranded nucleic acids by isolation and hybridisation of nucleic acid pools, then reading out, where the nucleic acids are selectively bound using capture agents that are (a) immobilised on the surface of a solid matrix and (b) comprise variable and non-variable regions. The capture oligonucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sorting single-stranded nucleic acid, useful for analyzing expression patterns and screening active agents, uses capture agent with variable and constant regions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   WPI; 2003-714082/68
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Boekenkamp D,

                                                                                                                       CC have a 5'-invariable anchor region, the complement of which is present at CC least once in each nucleic acid and a 3'-variable, discriminatory region CC that comprises all possible combinations of up to 10 nucleotides to allow binding of particular sorts of single stranded nucleic acids. The capture CC eagents are particularly locked nucleic acids (INA) and the anchor region CC comprises a sequence of 10-50, particularly 15-25, T residues. The CC capture oligonucleotides are biotinylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass, CC metal, resin, gel, crystalline material and/or membrane, having semicantal, resin, gel, crystalline material and/or membrane, having semicantal compacticularly a layer of (bio)molecular filaments and binding of single conducting properties and especially in the form of a chip. Its surface by tranded nucleic acids to the surface is (quasi)covalent, supramolecular, CC physical, stimulated by an electrical field or through a molecular sieve. The method is used (i) for analysis of patterns, especially in mucosal, cardityty of pharmaceuticals and/or nutritional compounds, e.g. food cadditives or supplements, especially minerals, trace elements, organic acids (amino, carboxylic or fatty acid) or their derivatives, salts and CC acids (amino, carboxylic or fatty acid) or their derivatives, salts and can be maderially in conducible cardity be made on comparison of nucleic acid pool. Since the method is based on comparison of nucleic acid pool. Since the capture nrobes used in the method of the heart of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   nucleic acids by isolation and hybridisation of nucleic acid pools, then reading out, where the nucleic acids are selectively bound using capture agents that are (a) immobilised on the surface of a solid matrix and (b)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sorting single-stranded nucleic acid, useful for analyzing expression patterns and screening active agents, uses capture agent with variable
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ss; hybridisation; capture oligonucleotide; pattern; mucosal; hair root;

Computes variable and nonverted to the complement of which is present at that comprises all possible combinations of up to 10 nucleotides to allow that comprises all possible combinations of up to 10 nucleotides to allow comprises a sequence of 10-50, particularly locked nucleic acids. The capture agents are particularly locked nucleic acids (LMA) and the anchor region comprises a sequence of 10-50, particularly 15-25, T residues. The capture compouncie otides are biotinylated and immobilised on a surface by conducting properties and especially in the form of a chip. Its surface conducting properties and especially in the form of a chip. Its surface is particularly a layer of (bio)molecular filaments and binding of single tranded nucleic acids to the surface is (quasi) covalent, supramolecular, chair root, blood, nerve or germ cells and (i) for analysis of patterns, especially in mucosal, thair root, blood, nerve or germ cells and (ii) for determining the acids (amino, carboxylic or fatty acid) or through a molecular sieve. Cc anditives or supplements, especially minerals, trace elements, organic acids (amino, carboxylic or fatty acid) or their derivatives, and carboxylic or fatty acid) or their derivatives, and carboxylic or fatty acid) or their derivatives, alls and carboxylic acids (and reproducible card minutes. The method provides rapid, inexpensive and reproducible and callows imaging of the complete pattern of all nucleic acid from cells. It can be the complete pattern of all nucleic acid sool. Since the method is based on comparison of nucleic acid pool. Since the carboxylic acid in the method of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 S
comprise variable and mon-variable regions. The capture of agents that are (a) immobilised on the surface of a solid matrix and (b) comprise variable and mon-variable regions. The capture oligonucleotides have a 5'-invariable anchor region, the complement of which is present at CC least once in each nucleic acid and a 3'-variable, discriminatory region that comprises all possible combinations of up to 10 nucleotides to allow binding of particular sorts of single stranded nucleic acids. The capture CC agents are particularly locked nucleic acids (LNA) and the anchor region CC comprises a sequence of 10-50, particularly 15-25, T residues. The CC capture oligonucleotides are biotinnylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass, CC metal, resin, gel, crystalline material and/or membrane, having semi-CC monducting properties and especially in the form of a chip. Its surface is particularly aleyer of (bio) molecular filaments and binding of single stranded nucleic acids to the surface is (quasi) covalent, supramolecular, CC physical, stimulated by an electrical field or through a molecular sieve. The method is used (i) for analysis of patterns, especially in mucosal, having the activity of pharmaceuticals and/or nutritional compounds, e.g. food additives or supplements, especially minerals, trace elements, organic crids (amino, carboxylic or fatty acid) or their derivatives, salts and cmixtures. The method provides rapid, innexpansive and reproducible crids in motorial compounds of the complete pattern of all nucleic acids from cells, and cell, and detect very small differences in pools of nucleic acids from cell, and cell, and can detect very small differences in the nucleic acid fina cell, and can detect very small differences in the nucleic acid sold in a cell, and cent detects the complete pattern of all nucleic acids from cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This invention describes a novel method for sorting single-stranded nucleic acids by isolation and hybridisation of nucleic acid pools,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sorting single-stranded nucleic acid, useful for analyzing expression patterns and screening active agents, uses capture agent with variable
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             WPI; 2003-714082/68
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        DE10208794-A1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Rat DNA microarray capture oligonucleotide

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Ś
creating out, where the nucleic acids are selectively bound using capture capents that are (a) immobilised on the surface of a solid matrix and (b) comprise variable and non-variable regions. The capture oligonucleotides capture as '-invariable anchor region, the complement of which is present at least once in each nucleic acid and a '-variable, discriminatory region that comprises all possible combinations of up to 10 nucleotides to allow comprises as sequence of 10-50, particularly to 15-25, T residues. The capture agents are particularly locked nucleic acids (LMA) and the anchor region comprises a sequence of 10-50, particularly 15-25, T residues. The capture of computer oligonucleotides are biotinylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass, conducting properties and especially in the form of a chip. Its surface is particularly a layer of (bio)molecular filaments and binding of single stranded nucleic acids to the surface is (quasi) covalent, supramolecular, chysical, stimulated by an electrical field or through a molecular sieve. The method is used (i) for analysis of patterns, especially in mucosal, activity of pharmaceuticals and/or mutritional compounds, e.g. food acidis (amino, carboxylic or fatty acid) or their derivatives, salts and cold additives or supplements, especially minerals, trace elements, organic acids (amino, carboxylic or fatty acid) or their derivatives, salts and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

                                                                                                      This invention describes a novel method for sorting single-stranded nucleic acids by isolation and hybridisation of nucleic acid pools, then reading out, where the nucleic acids are selectively bound using capture agents that are (a) immobilised on the surface of a solid matrix and (b) comprise variable and non-variable regions. The capture oligonucleotides have a 5'-invariable anchor region, the complement of which is present at least once in each nucleic acid and a 3'-variable, discriminatory region that comprises all possible combinations of up to 10 nucleotides to allow binding of particular sorts of single stranded nucleic acids. The capture degents are particularly locked nucleic acids (LNA) and the anchor region comprises a sequence of 10-50, particularly 15-25, T residues. The capture oligonucleotides are biotinylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass, metal, resin, gel, crystalline material and/or membrane, having semications and surface and surface to the particularly a surface of the particularly and the form of a chip. Its surface is particularly a surface is particularly a surface is particularly and binding of single
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

The method provides rapid, inexpensive and reproducible representation of differences in pools of nucleic acids from cells. It representation of end of the complete paths of all nucleic acid in a cell, a callows imaging of the complete serving of all nucleic acid in a cell, a can detect very small differences in the nucleic acid pool. Since the method is based on comparison of nucleic acid pools, not individual genes, matrix miniaturisation is possible. ADK01281-ADK01344 represent
       stranded nucleic acids to the surface is (quasi)covalent, supramolecular, physical, stimulated by an electrical field or through a molecular sieve. The method is used (i) for analysis of patterns, especially in mucosal,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sorting single-stranded nucleic acid, useful for analyzing expression patterns and screening active agents, uses capture agent with variable
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Example; Page 6; 8pp; German.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Boekenkamp D,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   activity of pharmaceuticals and/or nutritional compounds, e.g. food additives or supplements, especially minerals, trace elements, organic acids (amino, carboxylic or fatty acid) or their derivatives, salts and mixtures. The method provides rapid, inexpensive and reproducible representation of differences in pools of nucleic acids from cells. It allows imaging of the complete pattern of all nucleic acid in a cell, an can detect very small differences in the nucleic acid pool. Since the method is based on comparison of nucleic acid pools, not individual genes, matrix miniaturisation is possible. ADK01281-ADK01344 represent capture probes used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sorting single-stranded nucleic acid, useful for analyzing expression patterns and screening active agents, uses capture agent with variable and constant regions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             28-FEB-2002; 2002DE-01008794.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         04-SEP-2003
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ss; hybridisation; capture oligonucleotide; pattern; mucosal; hair root;
blood; nerve; germ cell; food additive; food supplement.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Rat DNA microarray capture oligonucleotide #31.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       06-MAY-2004
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ADK01311;

This invention describes a novel method for sorting single-stranded nucleic acids by isolation and hybridisation fucleic acid pools, then reading out, where the nucleic acids are selectively bound using capture agents that are (a) immobilised on the surface of a solid matrix and (b) comprise variable and non-variable regions. The capture oligonucleotides have a 5'-invariable anchor region, the complement of which is present at least once in each nucleic acid and a 3'-variable, discriminatory region that comprises all possible combinations of up to 10 nucleotides to allow binding of particular sorts of single stranded nucleic acids. The capture agents are particularly locked nucleic acids (LNA) and the anchor region comprises a sequence of 10-50, particularly 15-25, T residues. The capture oligonucleotides are biotinylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass, metal, resin, gel, crystalline material and/or membrane, having semi-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             activity of pharmaceuticals and/or nutritional compounds, e.g. food additives or supplements, especially minerals, trace elements, organic acids (amino, carboxylic or fatty acid) or their derivatives, salts and mixtures. The method provides rapid, inexpensive and reproducible representation of differences in pools of nucleic acids from cells. It allows imaging of the complete pattern of all nucleic acid in a cell, are can detect very small differences in the nucleic acid pool. Since the method is based on comparison of nucleic acid pools, not individual genes, matrix miniaturisation is possible. ADK01281-ADK01344 represent capture probes used in the method of the invention.
                            modified macromolecules. Specifically, it refers to a high throughput method for the parallel analysis of many potential sites of chemical modification (e.g. methylation) in DNA. The present invention describes treating the DNA with one or more chemical reagents that result in different base sequences depending upon the presence or absence of the modification of interest. Accordingly, a device comprising an array of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  stranded nucleic acids to the surface is (quasi)covalent, supramolecular, physical, stimulated by an electrical field or through a molecular sieve. The method is used (i) for analysis of patterns, especially in mucosal, hair root, blood, nerve or germ cells and (ii) for determining the activity of pharmaceuticals and/or nutritional compounds, e.g. food
                                                                                                                                                                                                                                                                                                                                              Analysis of chemical modification to be analyzed, treating DNA with
                                                                                                                                                                                                      This invention relates to a novel method for analysing chemically
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 27-JUN-2001; 2001US-0301370P
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     27-JUN-2002; 2002US-00184085
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human DNA probe used to immobilise CpG methylated DNA SeqID 176.

                                                                                  This invention relates to a novel method for analysing chemically modified macromolecules. Specifically, it refers to a high throughput method for the parallel analysis of many potential sites of chemical modification (e.g. methylation) in DNA. The present invention describes treating the DNA with one or more chemical reagents that result in different base sequences depending upon the presence or absence of the modification of interest. Accordingly, a device comprising an array of probes is provided to hybridise with and select the altered DNA sequences that comprise the modifications of interest such as a CpG island. In particular, this invention refers to analysing the methylation pattern of a region of the promoter for the tumour suppressor gene pl6 from two human lung tumour cell lines H69 and H1618. This oligonucleotide sequence is a human DNA probe used to immobilise CpG methylated DNA of the

                     CC composition also describes a kit, that comprises: (a) a delivery composition for absolutely and samular active and composition of the invention as antiallergic, antiating composition of a target polypeptide associated with lung airway or lung composition also describes a kit, that comprises: (a) a delivery composition of the invention has antiallergic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity is a beta-adrenergic agonist. The composition is useful for preventing or composition constitutes of increase high and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or creating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The conformation, allergies and/or surfactant hypoproduction are associated conformation, allergies and/or surfactant hypoproduction are associated conformation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    문
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         S

                                               inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymiddines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it
                                                                                                                                                                                                                            pulmonary
                                                                                         ő

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 cc device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition cc of the invention has antiallergic, antiinflammatory, antiasthmatic, canalgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to creduce the amount of target polypeptide present in the lungs. The cpulmonary obstruction, and/or bronchoconstriction and/or lung confilmmation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, confirmmation, allergies, asthma, impeded respiration, respiratory confilmmation, allergies, asthma, impeded respiration, respiratory confirmmation, allergies, asthma, impeded respiration, respiratory confirmation, allergies, asthma, impeded respiration, respiratory contained contents of the anti-sense oligos corresponding to the oligonacteotides into producte that free adenosine into the system confirmation in the target RNA serves to prevent the breakdown of the oligonacteotides into producte that free adenosine into the system confirmation in the target state free adenosine into the system confirmation in the same confirmation of the anti-sense oligos corresponding to the oligonacteotides into producte that free adenosine into the system confirmation and thereby, to prevent any unwanted effects due to it
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Best Local Similarity Matches 17; Conserv
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match
                                          The present invention relates to a polynucleotide isolated from a human gene and is useful for detecting a slingle nucleotide polymorphism in a human gene or for diagnosing of disease. The invention enables the detection of a slingle nucleotide polymorphism in a human gene. The present sequence represents a primer of the invention.

                                                                                                                                                                                                                                                                                            The present invention relates to a polynucleotide isolated from a gene and is useful for detecting a single nucleotide polymorphism human gene or for diagnosing of disease. The invention enables the detection of a single nucleotide polymorphism in a human gene. The present sequence represents a primer of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match
                         New polypeptides and nucleic acids, useful preventing liver disorder (e.g. cirrhosis, chronic hepatitis), or epithelial cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a novel intercalator having a specific formula. The intercalator of the invention may be useful for the electrochemical detection of a gene, as an electrochemical double stranded DNA detection reagent and as an intercalator for inhibiting the influence of mismatch DNA and single stranded DNA. The intercalator enables the transmission of electronic transition between two base pairs to occur efficiently. The current sequence is that of the electrochemical detection intercalator-
                                                                                                                                                                                                                                                                                                27-SEP-2002; 2002EP-00021696.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to the isolation of polypeptides and their encoding genes which are associated with liver disorders and epithelial cancers. The polypeptides, nucleic acids, milecules and compositions are useful for diagnosing, treating or preventing liver disorder (e.g. cirrhosis, alcoholic liver disease, chronic hepatitis, Wilson's Disease, heamochromatosis, hepatocellular carcinoma, benign liver neoplasms, and focal nodular hyperplasia), or epithelial cancer, which is an adenocarcinoma of the lung, the stomach, the kidney, the colon, the prostate, the skin, and the breast. This sequence represents an oligonucleotide associated with the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       US2004067490-A1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Disclosure;

                                                                      The invention relates to human NOVX polypeptides and polynucleotides. The isolated nucleic acids can be used to express the novel proteins, to detect novel mRNA or a genetic lesion in a novel gene and to modulate its activity. It can also be used in gene therapy for treating or preventing a pathology associated with the protein or nucleic acid. The disorders include metabolic disorders, diabetes, obseity, infectious diseases, anorexia, cancer, neurodegenerative disorders, linheimer's disease, Parkinson's disease, immune disorders and haematopoletic disorders. This sequence represents a probe used in analysis of expression of a human NOVX polynucleotide of the invention.
                                                                                                                                                                                                                           New isolated polypeptide, useful for treating or preventing a pathology associated with the polypeptide, e.g. diabetes, infectious disease, cancer, neurodegenerative disorders or {\tt Alzheimer}'s disease.
                                                                                                                                                                                                                                                                                                          Zhong M, Li L, Gorman L, Spytek KA, Kekuda R, Taupler RJ; Anderson DW, Vernet CAM, Catterton E, Miller CB, Shenoy SG; Patturajan M, Pena CEA, Tchernev VT, Padigaru M, Gusev VY; Malyankar UM, Burgess CB, Gerlach V, Casman SJ, Rieger DK; Grosse WM, Smithson G, Peyman JA, Starling G, Rothenberg ME; Larochelle WJ, Shimkets RA, Crabtree J, Rastelli L, Voss EZ; Boldog FL, Edinger SR, Millet I, Macdougall JR, Ellerman K;

The isolated nucleic acids can be used to express the novel proteins, to detect novel mRNA or a genetic lesion in a novel gene and to modulate its activity. It can also be used in gene therapy for treating or preventing a pathology associated with the protein or nucleic acid. The disorders include metabolic disorders, diabetes, obesity, infectious diseases, anorexia, cancer, nucrodegenerative disorders, Alzheimer's diseases, Parkinson's disease, immune disorders and haematopoietic disorders. This sequence represents a probe used in analysis of expression of a human NOVX polynucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Zhong M, Li L, Gorman L, Spytek KA, Kekuda R, Taupier RJ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to human NOVX polypeptides and polynucleotides. The isolated nucleic acids can be used to express the novel proteins, to detect novel mRNA or a genetic lesion in a novel gene and to modulate its activity. It can also be used in gene therapy for treating or preventing a pathology associated with the protein or nucleic acid. The disorders include metabolic disorders, diabetes, obesity, infectious diseases, anorexia, cancer, neurodegenerative disorders, Alzheiner's disease, Parkinson's disease, immune disorders and haematopoietic disorders. This sequence represents a probe used in analysis of expression of a human NOVX polynucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; NOVX; ss; metabolic disorder; diabetes; obesity; infectious disease; anorexia; cancer; neurodegenerative disorder; Alzheimer's disease; Parkinson's disease; immune disorder; haematopoietic disorder; antidiabetic; anorectic; antimicrobial;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New isolated polypeptide, useful for treating or preventing a pathology associated with the polypeptide, e.g. diabetes, infectious disease, cancer, neurodegenerative disorders or Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Zhong M, Li L, Gorman L, Spytek KA, Kekuda R, Taupier RJ;

It can also be used in gene therapy for treating or preventing a pathology associated with the protein or nucleic acid. The disorders include metabolic disorders, diabetes, obesity, infectious diseases, anorexia, cancer, neurodegenerative disorders, Alzheimer's disease, Parkinson's disease, immune disorders and haematopoietic disorders. This sequence represents a probe used in analysis of expression of a human NOVX polymucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; NOVX; ss; metabolic disorder; diabetes; obesity; infectious disease; anorexia; cancer; neurodegenerative disorder; Alzheimer; disease; Parkinson's disease; immune disorder; haematopoletic disorder; antidiabetic; anorectic; antimicrobial; anabolic; eating disorder; cytostatic; neuroprotective; nootropic; antiparkinsonian; antianaemic; probe.

                                                                                                                      The invention relates to human NOVX polypeptides and polynucleotides. The isolated nucleic acids can be used to express the novel proteins, to detect novel mRNA or a genetic lesion in a novel gene and to modulate its activity. It can also be used in gene therapy for treating or preventing a pathology associated with the protein or nucleic acid. The disorders include metabolic disorders, diabetes, obesity, infectious diseases, anorexia, cancer, neurodegenerative disorders, Nicheimer's diseases, Parkinson's diseases, immune disorders and haematopoietic disorders. This sequence represents a probe used in analysis of expression of a human NOVX polynucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Zhong M, Li L, Gorman L, Spytek KA, Kekuda R, Taupier RJ;

                                                                            Query Match
                                                                                                                           The invention relates to human NOVX polypeptides and polymucleotides. The isolated nucleic acids can be used to express the novel proteins, to detect novel mRNA or a genetic lesion in a novel gene and to modulate its activity. It can also be used in gene therapy for treating or preventing a pathology associated with the protein or nucleic acid. The disorders include metabolic disorders, diabetes, obesity, infectious diseases, anorexia, cancer, neurodegenerative disorders, Alzheimer's disease, parkingon's disease, immune disorders and haematopoietic disorders. This sequence represents a probe used in analysis of expression of a human NOVX polynucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                            Zhong M, Li L, Gorman L, Spytek KA, Kekuda R, Taupier RJ; Anderson DW, Vernet CAM, Catterton E, Miller CB, Shenoy SG; Patturajan M, Pena CEA, Tchernev VT, Padigaru M, Gusev VY; Malyankar UM, Burgess CB, Gerlach V, Casman SJ, Rieger DK; Grosse WM, Smithson G, Peyman JA, Starling G, Rothenberg ME; Larochelle WJ, Shimkets RA, Crabtree J, Rastelli L, Voss EZ; Boldog FL, Edinger SR, Millet I, Macdougall JR, Ellerman K;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to human NOVX polypeptides and polynucleotides. The isolated nucleic acids can be used to express the novel proteins, to detect novel mRNA or a genetic lesion in a novel gene and to modulate its activity. It can also be used in gene therapy for treating or preventing a pathology associated with the protein or nucleic acid. The disorders include metabolic disorders, diabetes, obesity, infectious diseases, anorexia, cancer, neurodegenerative disorders, Alzheimer's diseases, Parkinson's diseases, immune disorders and haematopoletic disorders. This sequence represents a probe used in analysis of expression of a human NOVX polynucleotide of the invention.
                  Diagnosing or monitoring transplant rejection, e. pancreas, pancreatic islet, lung, bone marrow or rejection, in an individual, comprises detecting the genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                transplant rejection; immune system; rheumatoid arthritis; lupus; inflammatory bowel disease; multiple sclerosis; HIV; AIDS; ss; probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New isolated polypeptide, useful for treating or preventing a pathology associated with the polypeptide, e.g. diabetes, infectious disease, cancer, neurodegenerative disorders or Alzheimer's disease.
                                                                                                                                                                                                                                  24-APR-2002; 2002US-00131831.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    rejection, e.g. cardiac or kidney transplant rejection, in an individual comprises detecting the expression level of one or more genes. The methods, system and kits are useful in diagnosing or monitoring transplant rejection, e.g. heart, kidney, liver, pancreas, pancreatic islet, lung, bone marrow or stem cell transplant rejection, in a individual. The method is also useful in assessing the immune status of an individual. The methods are also useful in diagnosing and monitoring diseases that involve the immune system, e.g. rheumatoid arthritis, lungs, inflammatory bowel diseases, multiple sclerosis, HTV/AIDS or viral, bacterial or fungal infection. The present sequence represents a probe for a 50 mer oligonuclectide marker for diagnosis and monitoring o
                                    The invention comprises oligonucleotides that detect polymorphisms within the pig KIT gene. The oligonucleotides of the invention may also detect polymorphisms within the pig melanocyte stimulating hormone-receptor (MCIR) gene. The oligonucleotides of the invention are useful for discriminating a variety of pig. The present DNA sequence represents a capture oligonucleotide that was used in an example of the invention.
                                                                                                                                                                                                         Oligonucleotide, useful for discriminating between varieties of pig by detecting specific polymorphisms of KIT and melanocyte stimulating hormone-receptor (MCIR) gene by hybridizing capture oligonucleotides and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             pig; porcine; polymorphism detection; KIT gene;
melanocyte stimulating hormone-receptor gene; M
capture oligonucleotide; ss.
